Technical Note - Pairing GN6210 Headsets

General:

Occasionally a GN6210 Bluetooth headset may lose connection to its base unit/cradle. When this happens, the headset will not work. This situation may be caused by the base unit losing power at a time that the headset is not charging in it. This can be due to your power utility having a power supply failure or an electrician turning the power off for protection while they work.

The solution to this is to restore the pairing (i.e. connectivity).

Pairing Process:

1. Ensure that the headset is turned off.
2. Ensure that the headset and base unit are within 1 metre of each other and are away from any other units.
3. Press and hold the “on” button on the headset until the blue light on the headset is on solid. This may take up to 10 seconds.
4. Press and hold the “multifunction” button on the base unit until the pairing indicator (blue light) is on solid.
5. 10 rapid flashes of the blue light on both the headset and the base unit plus two beeps of tone in the headset will verify correct pairing.
